

GLIP Security Evidence Package

Project: GLIP Foundation

Contract: 0xD0b86b79AE4b8D7bb88b37EBe228ce343D79794e

Purpose: Supporting documentation for CoinGecko token listing review.

1. Executive Summary

GLIP requested a paid Manual Security Review from GoPlus Security after CoinGecko recommended obtaining an independent third-party assessment or providing technical explanations for administrative permissions.

2. GoPlus Manual Review Outcome

GoPlus manually reviewed the contract and officially removed the Mint Warning. GoPlus confirmed that the remaining warnings are associated with actual administrative protection mechanisms present in the contract (burn, pause and freeze), therefore those labels remain.

3. Technical Clarifications

Mint: No external mint() function exists. Total supply is fixed after deployment.

Balance Modification: Only burn(address,uint256) exists. It can permanently destroy tokens but cannot create new tokens or increase balances.

Pause: Emergency protection mechanism for critical incidents only.

Freeze / Blacklist: Intended only for compromised wallets, theft recovery, phishing incidents or legal compliance.

Ownership: Retained during the early operational stage for emergency administration. Long-term roadmap includes progressive decentralization.

4. Trading Characteristics

- Verified contract on Etherscan
- Open source
- No proxy contract
- Buy Tax: 0%
- Sell Tax: 0%
- No honeypot

5. Operational Statement

Since deployment, the owner permissions have never been exercised to manipulate token supply, restrict normal trading, arbitrarily freeze legitimate users, or modify holder balances for administrative advantage. Administrative permissions have been retained solely as emergency safeguards.

6. Supporting Evidence
